## Subsetting Data in R

Data Wrangling in R

## Dealing with Missing Data

#### Missing data types

One of the most important aspects of data cleaning is missing values.

Types of "missing" data:

- NA general missing data
- Nan stands for "Not a Number", happens when you do 0/0.
- Inf and -Inf Infinity, happens when you take a positive number (or negative number) by 0.

## Finding Missing data

Each missing data type has a function that returns TRUE if the data is missing:

- NA-is.na
- · NaN is.nan
- Inf and -Inf is.infinite
- · is.finite returns FALSE for all missing data and TRUE for non-missing

#### Missing Data with Logicals

One important aspect (esp with subsetting) is that logical operations return NA for NA values. Think about it, the data could be > 2 or not we don't know, so R says there is no TRUE or FALSE, so that is missing:

```
x = c(0, NA, 2, 3, 4)

x > 2
```

[1] FALSE NA FALSE TRUE TRUE

## Missing Data with Logicals

What to do? What if we want if x > 2 and x isn't NA? Don't do x != NA, do x > 2 and x is NOT NA:

```
x != NA
[1] NA NA NA NA NA
x > 2 \& !is.na(x)
```

[1] FALSE FALSE TRUE TRUE

#### Missing Data with Logicals

What about seeing if a value is equal to multiple values? You can do (x == 1 | x == 2) & !is.na(x), but that is not efficient.

```
(x == 0 | x == 2) # has NA

[1] TRUE NA TRUE FALSE FALSE

(x == 0 | x == 2) & !is.na(x) # No NA
```

[1] TRUE FALSE TRUE FALSE FALSE

what to do?

#### Missing Data with Logicals: %in%

Introduce the %in% operator:

```
x %in% c(0, 2) # NEVER has NA and returns logical
```

[1] TRUE FALSE TRUE FALSE FALSE

reads "return TRUE if x is in 0 or 2". (Like inlist in Stata).

## Missing Data with Logicals: %in%

NEVER has NA, even if you put it there (BUT DON'T DO THIS):

```
x %in% c(0, 2, NA) # NEVER has NA and returns logical

[1] TRUE TRUE TRUE FALSE FALSE

x %in% c(0, 2) | is.na(x)

[1] TRUE TRUE TRUE FALSE FALSE
```

## Missing Data with Operations

Similarly with logicals, operations/arithmetic with NA will result in NAS:

```
x + 2

[1] 2 NA 4 5 6

x * 2

[1] 0 NA 4 6 8
```

#### UFO data again

```
ufo = read csv("../data/ufo/ufo data complete.csv", col types =
                 cols(
                   .default = col character(),
                   \dot{} duration (seconds) \dot{} = col double(),
                   longitude = col double()
                 ) )
head (ufo)

#### Filtering and tibbles

Missing value and filter can be powerful (head - show first few rows)

```
ufo %>%
  filter(is.na(state) | is.na(country)) %>%
  head
# A tibble: 6 x 11
  datetime city state country shape `duration (seco... `duration (hour... comment
        <chr> <chr> <chr> <chr>

# ... with 3 more variables: `date posted` <chr>, latitude <chr>, longitude <db1
```

#### Filtering and tibbles

#### Group logical statements with parentheses

# **Renaming Columns**

#### Renaming Columns of a data.frame

To rename columns in dplyr, you use the rename command (NEW=old)

#### Renaming All Columns of a data. frame: dplyr

To rename all columns you use the rename all command (with a function)

#### Adding columns to a data.frame

6 TN

mutate - allows you to add or replace columns (need to reassign for it to stick)

```
ufo2 = ufo %>% mutate(State = toupper(state)) # we renamed city
ufo2 %>% select(State) %>% head

# A tibble: 6 x 1
   State
   <chr>
1 TX
2 TX
3 <NA>
4 TX
5 HI
```

#### Recoding to missing

Sometimes people code missing data in weird or inconsistent ways.

```
ages = data.frame(age = c(23,-999,21,44,32,57,65,54)) range(ages$age)
```

[1] -999 65

#### Adding new columns to a data.frame: base R

Can also use \$ to add columns, but only one column at a time

```
ufo2$State2 = tolower(ufo2$State)
ufo2 %>% select(state, State, State2) %>% head

# A tibble: 6 x 3
    state State State2
    <chr> <chr> <chr>    tx
1 tx TX tx
```

2 tx TX tx 3 <NA> <NA> <NA> 4 tx TX tx 5 hi HI hi

6 tn TN tn

#### Creating conditional variables

One frequently-used tool is creating variables with conditions.

A general function for creating new variables based on existing variables is the ifelse() function, which "returns a value with the same shape as test which is filled with elements selected from either yes or no depending on whether the element of test is TRUE or FALSE."

```
ifelse(test, yes, no)

# test: an object which can be coerced
    to logical mode.

# yes: return values for true elements of test.
# no: return values for false elements of test.
```

## Recoding to missing

How do we change the -999 to be treated as missing?

```
ages = ages \% mutate(age = ifelse(age == -999, NA, age))
range (ages$age)
[1] NA NA
range(ages$age,na.rm=TRUE)
[1] 21 65
ages
  age
 23
2 NA
3 21
4 44
  32
  57
  65
  54
```

## Recoding from missing

What if you were the person that coded the -999

#### Adding columns to a data. frame: dplyr

```
ufo = ufo %>% mutate(
           region = ifelse(
             country %in% c("us", "ca"),
             "North America",
             "Not North America")
ufo %>% select(country, region) %>% head
# A tibble: 6 x 2
 country region
 <chr> <chr>
1 us North America
2 <NA> Not North America
3 gb Not North America
4 us North America
5 us North America
6 us North America
```

### Adding columns to a data. frame: dplyr

Alternatively, case when provides a more general way:

```
ufo = ufo %>% mutate(
            region = case when (
              country %in% c("us", "ca") ~ "North America",
              country %in% c("de") ~ "Europe",
              country %in% "gb" ~ "Great Britain",
              TRUE ~ "Other"
ufo %>% select(country, region) %>% head
# A tibble: 6 x 2
 country region
 <chr> <chr>
1 us North America
2 <NA> Other
3 gb Great Britain
4 us North America
5 us North America
6 us North America
```

#### Ordering the rows of a data. frame: dplyr

The arrange function can reorder rows By default, arrange orders in ascending order:

```
ufo %>% arrange(duration s)
```

```
# A tibble: 88,875 x 12
   datetime City state country shape duration s `duration (hour... comments
   <chr> <chr> <chr> <chr>
                                                \langle dbl \rangle \langle chr \rangle
                                    <chr>
                                                                          <chr>

#### Ordering the rows of a data. frame: dplyr

It is a bit more straightforward to mix increasing and decreasing orderings:

```
ufo %>% arrange(country, desc(duration s))
# A tibble: 88,875 x 12
   datetime City state country shape duration s `duration (hour... comments
